

1 As a Developer faced
2
3 Dealing with developers from offshore / issues?
4 dealing with difficult people,
5 dealing
6
7
8 with buggy APIs from vendors. (trade)
9
10 Designing and incorporating feedback from business and customers?
11 getting agreement on the requirements
12
13 Working with teams spread out globally. :
14
15 Working with such teams (that work in different time zones)
16 involves hand-offs at the end of your shift and beginning of their shift.
17 You have to explain things ranging from business requirements,
18 design decisions and development decisions to details of coding,
19 modularization, unit test cases within a short couple of hours.
20
21
22 Challenges as technically leading has different issues deciding on right
23 technology stack, maintaining code quality,
24 and delivery ,
25 ensuring right engineering practices are in place ,
26 coding standards benchmarks and
27 quality checks as a leader,
28
29
30 communication, abstraction, interface design,
31 division of responsibility, testing discipline,
32 and adaptability to ever-evolving requirements
33
34 ---
35
36 Code review process :
37
38 Documentation - using
39 and code comments(template),
40 Code review with peer
41 beware the team context.
42 appropriate tests , making sure 80% coverage of the code.
43
44 Prod issue debug :
45 When things go wrong :
46
47 the golden rule is minimizing client impact.
48
49 even if it's a "one line change", the first thing to do is rollback.
50 Go back to the previous working state. This is the quickest way to get clients back
on a working version.
51
52 breadth-first search before a depth-first search, to get rid of the top level
nodes. What can I confirm using current resources?
53
54 Is the machine up?
55 Is the right code installed?
56 Is the config in place?
57 < Code specific configuration >, like is the routing in the code correct?
58 Is the schema version correct?
59 Then, get into the code.
60
61
62 I think three components make up monitoring:
63 - logging, metrics, and alarms.
64 Logging in code, just like the human log, is an evolutionary process.
65
66 -----
67 merge sort, quick sort
68
69 -----
70
71 Design questions :

72 Design a system which takes text, parses and gets related data from 3rd party web
services.
73 Eg: take city name and get weather and related info. such as news.
74 What database schema would you use to store the data if you don't want to query it
once you got the results.
75
76 -> ANS : Using distributed cache or ES to store the data , not saving the data in DB.
since the data is more transactional
77
78
79 Design a custom data structure (I don't remember the question properly).
80 the problem involves storing the data into objects and sorting them in an order so
that you can retrieve it easily.
81
82 -> ANS : using comparator , with merge sort.
83
84 Can you give me a small way to know whether an email is read by a recipient?
85
86 ->ANS : ReadReceiptReceivedListener, take the kafka event listener example.
87
88
89 Swap two numbers
90
91 -ANS->
92 first = first - second;
93 second = first + second;
94 first = second - first;
95
96
97
98
99
